

Project Questions

1. 5 Additional Rules

- An employee can only be assigned to one department at a time
- Before the next round of an interview can be scheduled, a grade must be reported
- A product's list price must be greater than its total part cost.
- An employee cannot supervise more people than their rank allows.
- An employee's salary amount cannot be negative.

2.

Yes the ability to model super-class/subclass relationships is important in such an environment. In this instance the company has people who can be an employee, a customer, and a potential employee all at the same time. You need to be able to model that with a superclass/subclass structure. It makes it easy to store shared information once and track what is different about each role individually. Without this it would get very complicated.

3.

A relational DBMS like Oracle would work well for the company. It has a lot of structured data that connects to each other including employees, departments, products, and vendors. SQL makes it easy to query all of that and get useful information out of it.

Confidential Report

Omar and Nicholas:

In this project we designed and implemented a relational database for a business that manufactures their own products. We started with creating an ER diagram that showed the main entities. We then translated that into the relational schema and then the DDL. From there we created view statements and queries. During this project I learned a lot about creating a database and how it looks when putting it all together. Me and my teammate contributed equally and worked on every part together from the start to finish.
